

Creating a world
fit for the future

The development effort required to accelerate vessel deployment of zero carbon fuels

Mark Parrett, November 2019

© Ricardo plc 2019

www.ricardo.com

The material in this presentation is a high level overview of the anticipated R&D effort to determine which zero carbon energy solutions are suitable for future transoceanic shipping, considering only on vessel aspects. It was presented by Ricardo's Technology Strategy consulting team at the Environmental Defense Fund event 'Navigating towards a zero-carbon future' on 8th November 2019 at the IMO, London. The material is intended to provoke discussion and should not be reviewed out of the context in which it was presented. For more information please contact info@ricardo.com.

Introduction:

R&D considerations for decarbonising transoceanic shipping

Scope

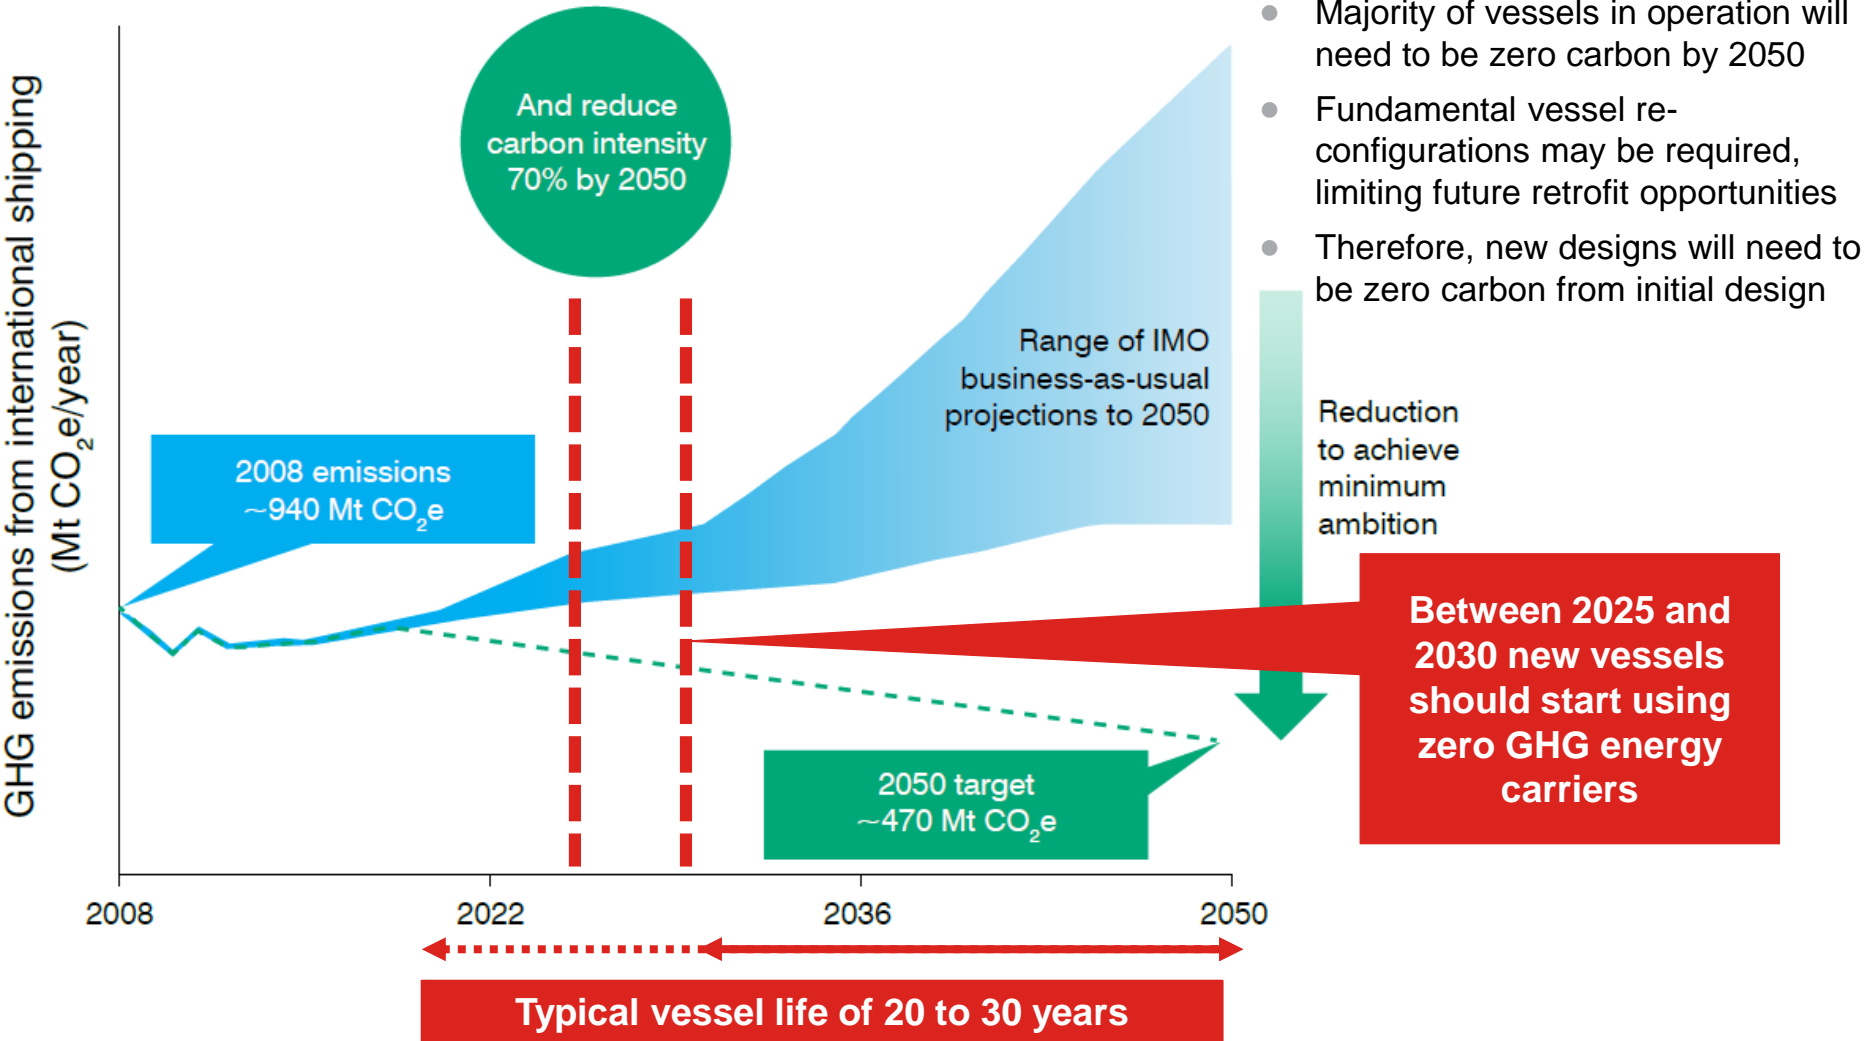

- ✓ Technology development acceleration
- ✓ Vessel technology
- ✓ Zero carbon energy carriers only
- ✗ Political, commercial, financial aspects
- ✗ Port / bunker infrastructure / technology
- ✗ 'Carbon neutral' energy carriers
- ✗ Zero carbon fuel production

Focus

- ➔ Transoceanic marine challenge
- ➔ Focus on container, bulk carrier, tanker

To meet the IMO's 2050 absolute GHG targets will require the first zero carbon fuelled vessels operating in the water between 2025 & 2030

- Majority of vessels in operation will need to be zero carbon by 2050
- Fundamental vessel re-configurations may be required, limiting future retrofit opportunities
- Therefore, new designs will need to be zero carbon from initial design

Energy density of lower carbon and zero carbon fuels will likely result in different solutions for different vessel types and sectors

Equivalent energy storage volumes:

Equivalent volume in TEUs displaced from an ULCV¹:

Source: Ricardo analysis based on LHV | [1] ULCV is an Ultra Large Container vessel and is assumed as 15,000 TEUs | TEU = Twenty-foot Equivalent Unit | [2] Potentially zero carbon

Technology Readiness Levels (TRL) show the steps required from research through to on vessel deployment

| TRL | Explanation |
|-----|---|
| 1 | Basic principles of scientific research observed and reported |
| 2 | Invention and research of practical applications |
| 3 | Proof of concept with analytical and experimental studies to validate the critical principles of individual elements of the technology |
| 4 | Development and validation of component in a laboratory |
| 5 | Pilot scale testing of component in a simulated environment to demonstrate specific aspects of the design |
| 6 | Prototype system built and tested in a simulated environment |
| 7 | Prototype system built and validated in a marine operational environment |
| 8 | Active commissioning where the actual system is proven to work in its final form under expected marine operating conditions |
| 9 | Operational application of system on a commercial vessel |

← Basic research

Limited R&D requirement

← Development

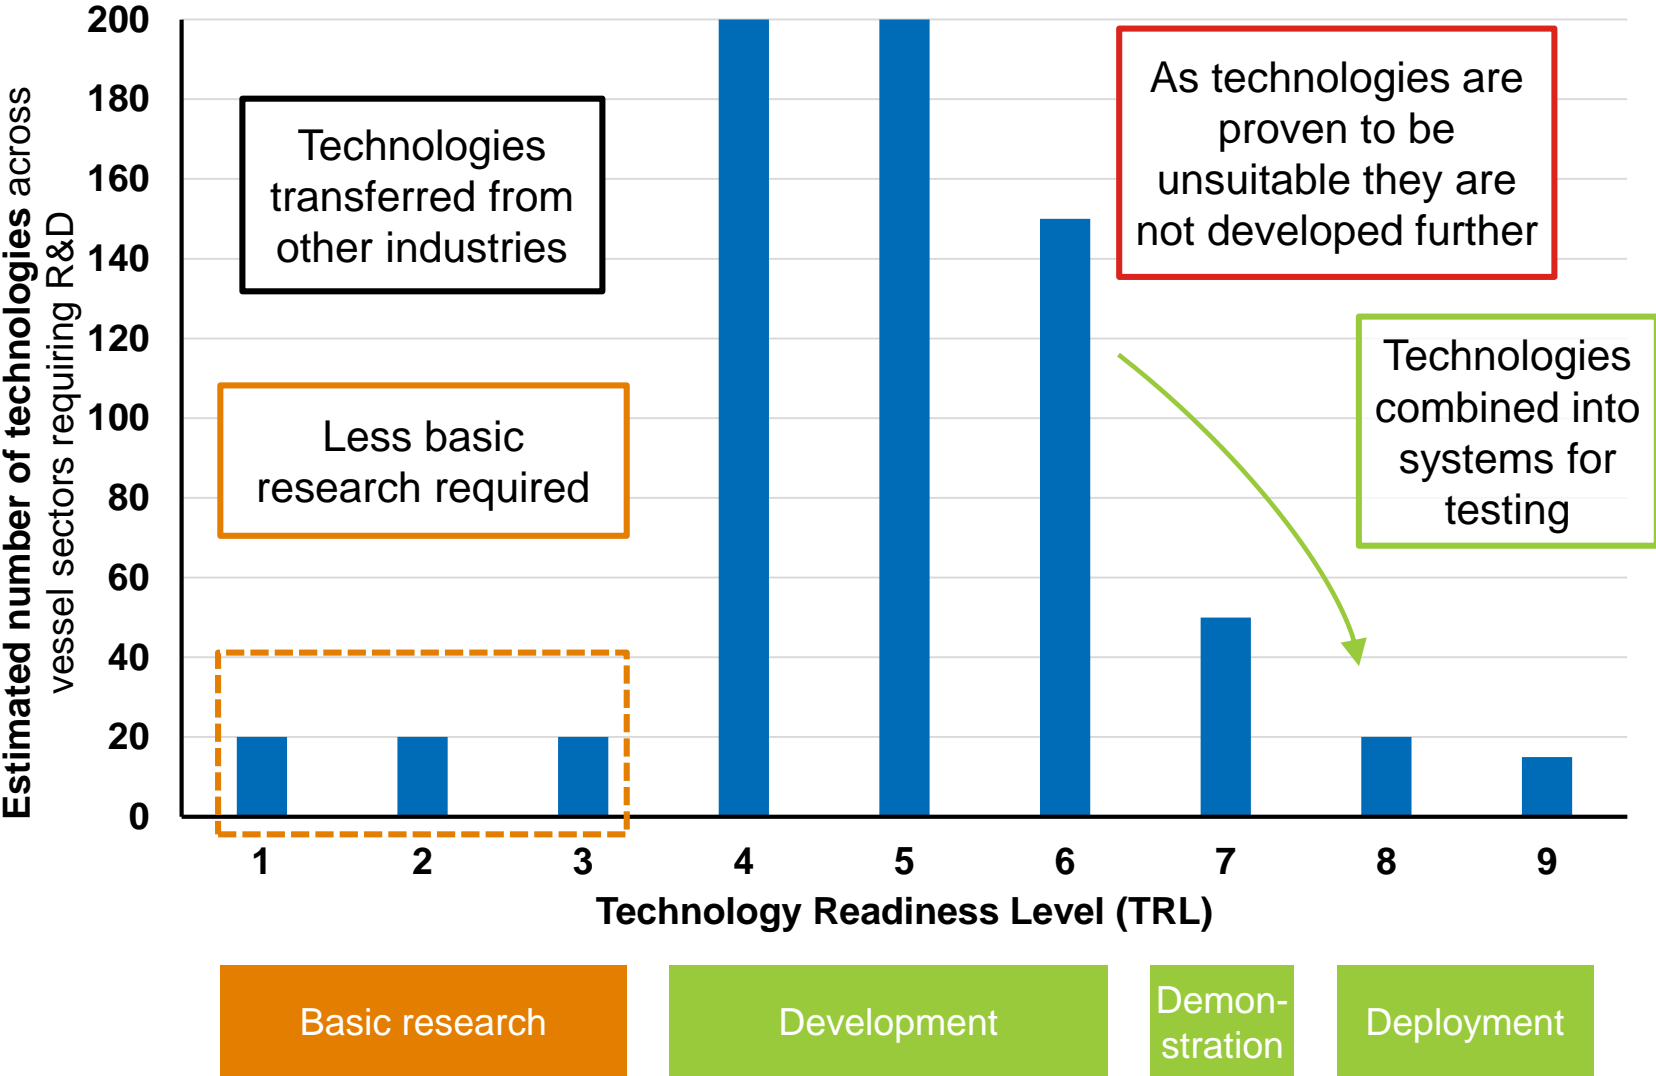

← Demonstration

← Deployment

Significant R&D effort required for marine

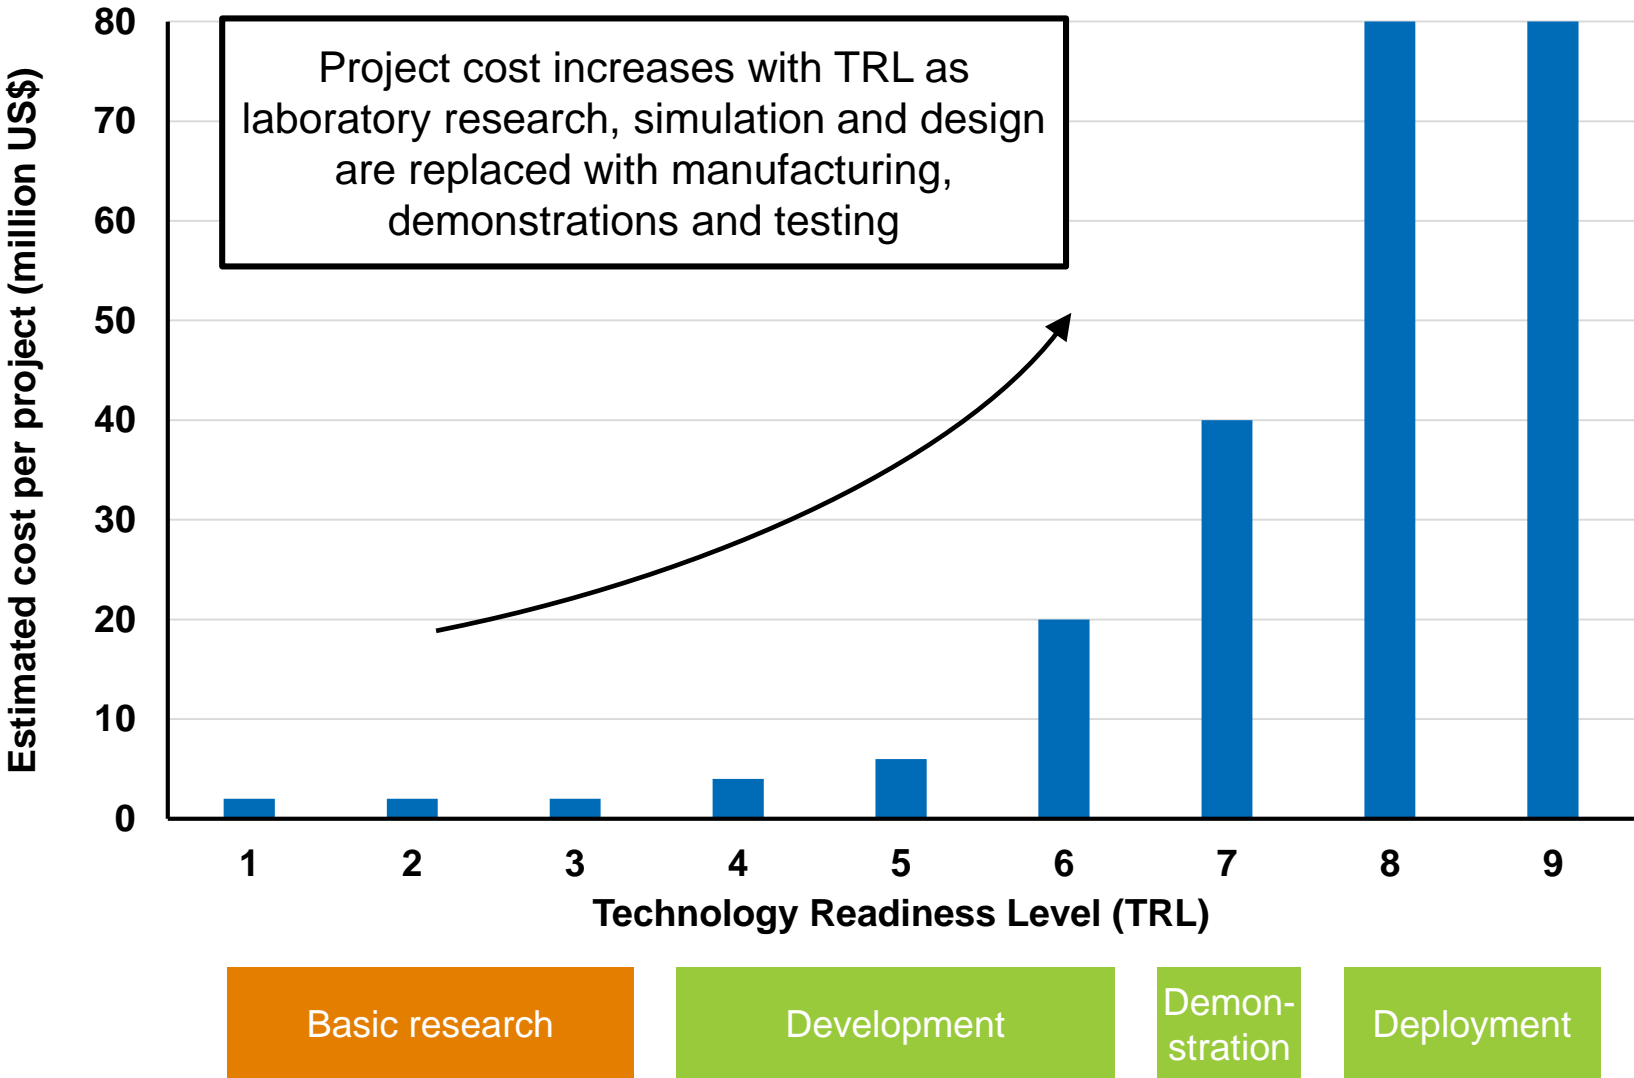

Source: Based on US DoD TRL

At least 200 projects are required for widespread deployment of zero carbon vessels, reducing to 15 to 20 commercial sea trials

Source: Ricardo indicative analysis

Total vessel R&D investment required is estimated to be US\$10bn – collaboration will likely be essential to successfully decarbonise

Source: Ricardo indicative analysis

Batteries

Advantage: zero emission use; fewer moving parts

Gap: significant R&D to scale and ensure robustness for transoceanic

- Renewable electricity = zero carbon
- **A pure battery electric** transoceanic ship would require a battery of ~15 GWh (~tens of kt; ~100x largest battery array)
- **Smaller battery hybrid** vessels offer more commercially viability
 - Internal combustion engine hybrids with zero carbon fuels have potential benefits for entering and leaving ports
 - Fuel cell systems require a battery hybrid system to allow load variation
 - ➔ Hybrid zero carbon vessels may still require a relatively large battery array
- Technology transfer from automotive and power industries
- R&D challenges
 - **Electrical system scale**
 - **Robustness** in a harsh environment

Current battery TRL **4 / 5 / 6**

Examples of R&D projects

| Maintenance of battery systems | |   |
|---------------------------------------|----------------|---|
| Vessel system | Energy Storage | Design and development of equipment for safe removal of battery modules at sea, including an on-ship battery systems workshop |
| Vessel sector | All | |
| TRL development | 4 ➔ 7 | |

| Battery array design and analysis | |   |
|--|------------------------------|---|
| Vessel system | Energy Storage | Design and analysis of a transoceanic battery array for a hybrid power system in a specific vessel class Considering thermal management and design for maintenance |
| Vessel sector | Array specific to each class | |
| TRL development | 5 ➔ 6 | |

* Base on an Ultra Large Container Vessel

Hydrogen

Advantages: compatibility, simpler production

Gap: challenges with on-board storage systems and safety

- “Green hydrogen” = zero carbon
- **Compatible power systems**
 - Internal combustion engines (SI & DF)
 - Fuel cells (PEMFC & SOFC)
- **R&D challenges**
 - **Safety** – demonstration projects will be required to demonstrate the risk of explosivity is mitigated
 - **Storage systems** – density and energy requirements to maintain -253°C
 - **Robustness** of fuel cells in a harsh environment and **scaling** of fuel cells
- Limited commercial deployment in other industries

Current hydrogen TRL 3 / 4 / 5

Examples of R&D projects

| Safe engine room concept with hydrogen | | H₂ \$ |
|---|-------------|---|
| Vessel system | Engine room | SOLAS: Development of proven guidelines to ensure safe ventilation of hydrogen from engine rooms on transoceanic shipping |
| Vessel sector | All | |
| TRL development | 5 → 7 | |

| 50 MW hydrogen fuel cell system, testing, validation and development | | H₂ \$\$\$\$ |
|---|--------------|---|
| Vessel system | Power system | 50 MW fuel cell system manufactured and then tested on-shore over a range of different operating and ambient conditions |
| Vessel sector | All | |
| TRL development | 5 → 6 | |

Ammonia

Advantage: higher energy density than hydrogen

Gap: R&D needed to address toxicity and fuel cell development

Current ammonia TRL **2 / 3 / 4 / 5**

- ‘Green ammonia’ = zero carbon
- **Storage** as liquid at 10 bar or -33 °C
 - Handling experience from the chemical industry
- **Compatible power systems**
 - Internal combustion engines (SI & DF)
 - Development required and a supporting fuel
 - Fuel cells (SOFC)
- **R&D challenges**
 - **Safety** – ammonia toxicity, so vigorous R&D will be required to ensure that ammonia is not released to atmosphere under any circumstance
 - **Robustness** of fuel cells in a harsh environment and **scaling** of fuel cells

Examples of R&D projects

| | | |
|--|--------------|---|
| Ammonia cold start emissions strategy | |   |
| Vessel system | Power system | Development of a strategy and technology system to prevent release of ammonia into the atmosphere before the aftertreatment is effective |
| Vessel sector | All | |
| TRL development | 4 → 5 | |

| | | |
|---|--------------|---|
| Waste heat recovery demonstration in vessel with ammonia fuel cell | |   |
| Vessel system | Power system | On vessel demonstration system for use under commercial shipping activities |
| Vessel sector | All | |
| TRL development | 7 → 8 | |

A multi disciplinary technology approach to R&D is needed promptly across the shipping industry for effective decarbonisation by 2050

For new energy carriers new on vessel technology will be required, with likely different solutions for each sector, vessel types and routes

- Fuel storage
- On vessel fuel transportation
- Propulsion
- Auxiliary power
- Waste heat recovery
- Refrigeration
- Emissions control
- Engine room safety
- Wider vessel safety
- Vessel configuration and cargo
- Voyage adjustments & re-optimisations
- Logistics adjustments & re-optimisation
- and many more

Circa US\$10 billion are required for on vessel and power system R&D

+ Vessel efficiency will need to increase to reduce freight / tonne energy demands

- Hull drag reduction
- Assistance technology
- Propeller efficiency
- Superstructure drag
- and many more

+ Fuel R&D
+ Shoreside infrastructure

R&D driven decisions on fuels need to happen promptly for a zero carbon fleet by 2050
